

1. Test Plan & Cases

- **Unit Testing:** Targeted testing for HouraBLL services (e.g., TimeBankService, PostApplicationService) using xUnit and Moq to ensure business rules (like preventing negative time balances) execute correctly without database dependencies.
- **Integration Testing:** Verifying that HouraDAL correctly interacts with the SQL Server via EF Core.

Sample Test Cases:

Test ID	Module	Scenario	Expected Result	Status
TC-01	Auth	Login with invalid credentials	Display "Invalid email or password" error	Pass
TC-02	Wallet	Exchange time with insufficient balance	Transaction aborted, show "Insufficient Time Credits"	Pass
TC-03	Service	User tries applying to their own service	Application rejected by validation logic	Pass

2. Bug Reports

Issue ID	Description	Severity	Resolution Status
BUG-001	Passwords currently stored in plain text (PasswordHash field).	Critical	Pending: Implement BCrypt/Identity hashing.
BUG-002	Missing [ValidateAntiForgeryTokenToken] on Login and SignUp POST forms.	High	Pending: Add tokens to forms and controller actions.
BUG-003	404 Errors on static views (Contact, Faq, Feedback, QuickLearning) due to missing controller actions.	Medium	Pending: Create routing actions in HomeController.
BUG-004	Typo in JavaScript filename (browes.js instead of browse.js).	Low	Pending: Rename file and update references.
